Shall also visualize & generate a 3D map of the SW+HW readings in real time, industry grade useful for proffesional

The o/p's given.

→ Calculate heat produced by HW, in all ranges of execution of the model on HW
- create small tab which opens industry-grade maps for heat generation

→ Shall give Energy consumption in all metrics, with industry-grade plots

→ Shall give memory maps - on how memory is being utilised at diff stages & ranges

→ Shall give all time-related info, delays, time-taken etc.

→ Cooling techniques (analyse all available techniques in the world all time) shall be given this model+HW execution
[full on map of HW generated like what cooling is needed at each spot of HW] shall be sustainable technique only]

The Green Computer

Opening Page
Sign In - Create Account
└ Login

delete account

INTRO PAGE:
- welcome
- Import & our system on glove animation & stuff
- Get started

Input Page

→ upload your AI model files
- System shall tell what files to upload
- perform minimum verification to check if uploaded files are correct

→ Upload HW files
- upload HW design files [info, board description, microcontroller architecture assembly, basic chip design used]
- our system shall specify what type of files req
- perform minimum verification to check if files are valid

→ Constraints
└ system performance constraints must be specified
- environment constraints also

The system working :-

→ create a virtual HW according to all the HW files provided

→ Run the AI model given on the virtual HW.

→ Run it with full exhaustion of model, on all ranges

→

RECOMM PAGE:

SW recommendations: ① → Model optimization techniques
→ Quantisation techniques wrt HW
→ Every recomm shall not affect efficiency / accuracy of model
→ Model implementation changes

HW
② → Microcontroller Architecture changes
→ Chip Design changes
→ RAM, ROM, memory size changes
→ Circuit changes

Then present 10 tabs with recommend changes and applications :-
↳ Like show all o/p params with each tab design [HW+SW changes] and help users choose of

Final Export
↳ After selecting the rec. changes
↓
Show the HW+SW new improved params, same like o/p panel
↓
New model files — export
New HW design files — export
Changes & params — export
↓
- Store history of each usage — accessible
- Track on account usage
- exit()
